

Charm decays at Belle

We study the decay properties of the D_s^+ using a large data sample collected by the Belle detector at the KEKB asymmetric energy e^+e^- collider. Measurements of the relative branching fractions of $K_S \pi$ and $K_S K$ states, the observation of the doubly Cabibbo-suppressed decay $D_s^+ \rightarrow K^+ K^0 \pi^-$ are presented, and other properties are presented.
