

# [919] $b \rightarrow d$ and other charmless $B$ decays at Belle

Cheng-Chin Chiang

National Taiwan University, Taiwan

18 July 2009 Kraków, Poland

The 2009 Europhysics Conference  
on High Energy Physics

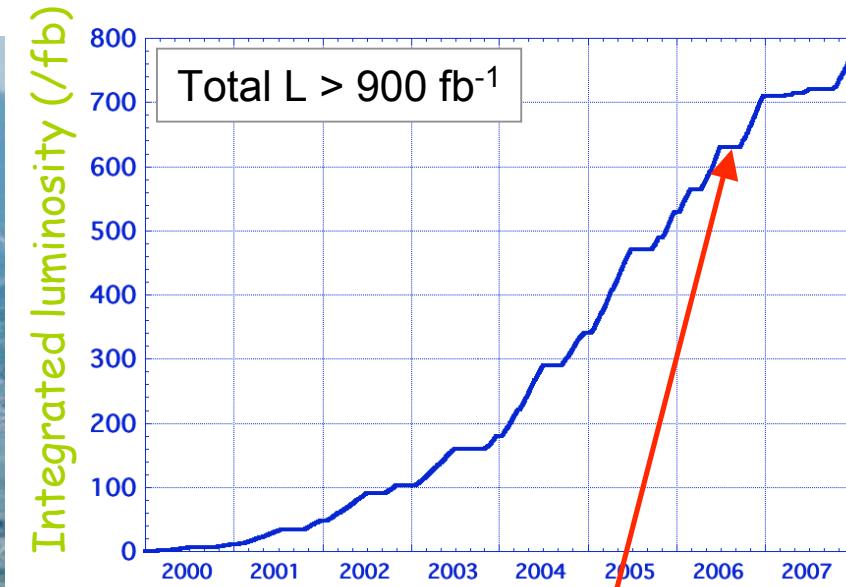

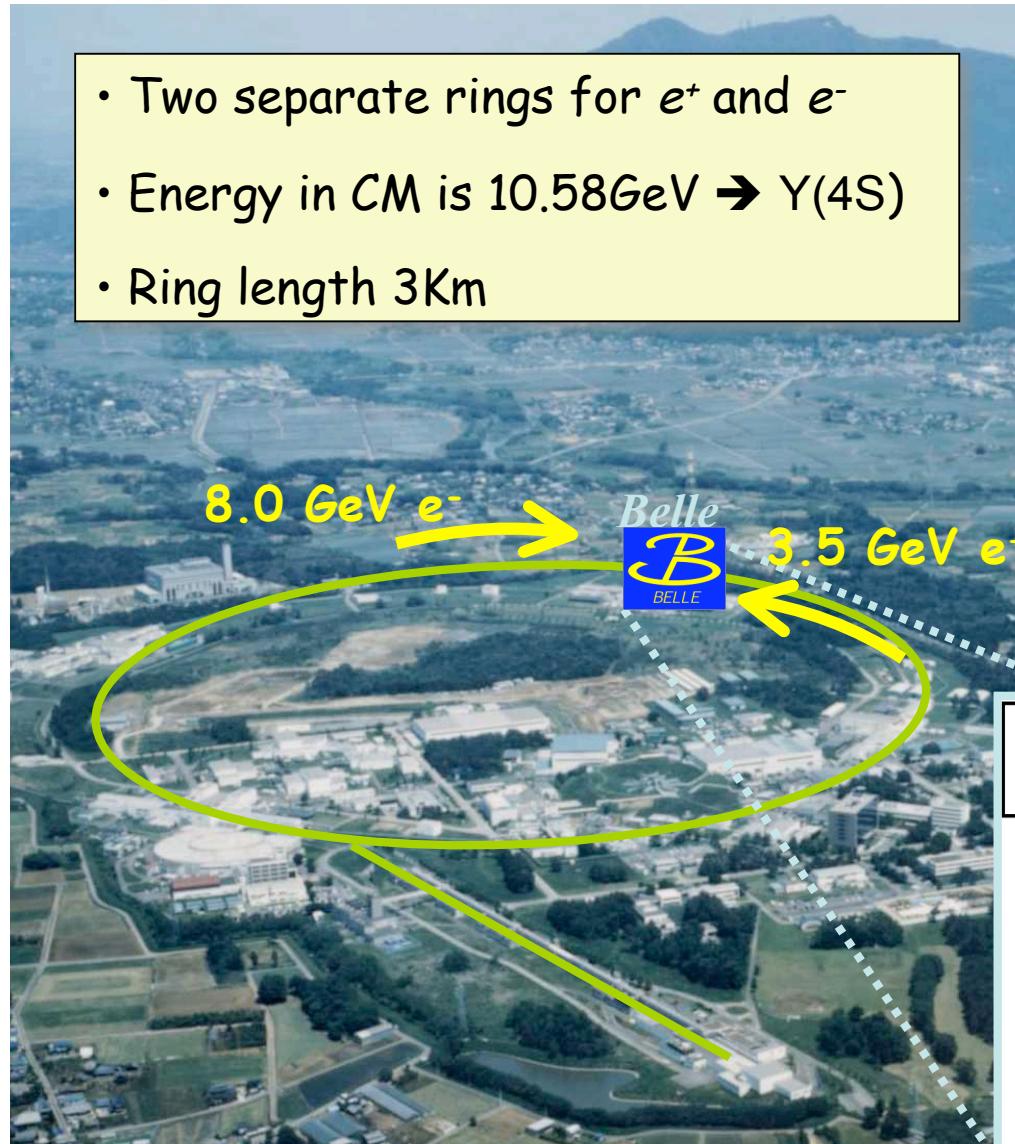

National Taiwan University

# Outline

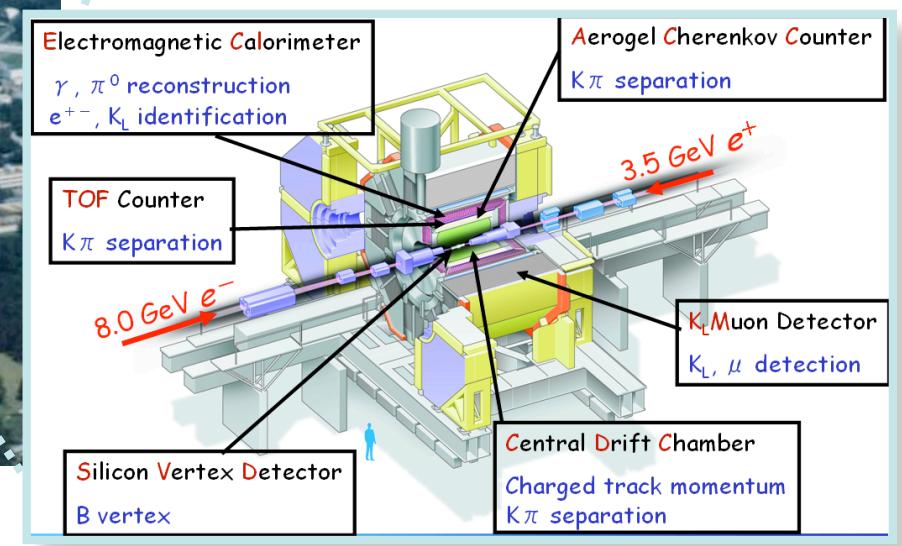

- The KEKB and Belle Detector
- $B^- \rightarrow K^{*0} K^-$  Decay  
**(Preliminary result)**
- $B^0 \rightarrow K^{*0} \bar{K}^{*0}$  and  $B^0 \rightarrow K^{*0} K^{*0}$  Decays  
**(Preliminary results)**
- Summary

# KEKB $e^+e^-$ Collider

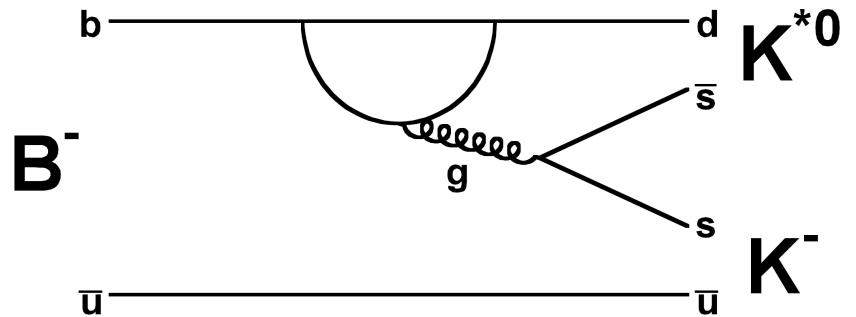

Results are based on 657  $M\bar{B}\bar{B}$  pairs

# $b \rightarrow d$ FCNC process: $B^- \rightarrow K^{*0} K^-$ decay

- $b \rightarrow dg$  process: One-loop penguin  $\rightarrow$  Sensitive to new physics

- Analogous to  $b \rightarrow s$  penguin but more suppressed

$$\Gamma(b \rightarrow d)/\Gamma(b \rightarrow s) \sim |V_{td}|^2/|V_{ts}|^2 \sim 4\%$$

- Currently, only a few  $b \rightarrow dg$  modes are observed

$B^0 \rightarrow K^0 K^0$  BaBar [PRL 97, 171805 (2006)], Belle [ PRL 98, 181804 (2007)]

$B^0 \rightarrow K^{*0} \bar{K}^{*0}$  BaBar [PRL 100, 081801 (2008)]

- Current status of the of  $B^- \rightarrow K^*(892)^0 K^-$  measurements : UL only

- Exp. CLEO BF  $< 5.3 \times 10^{-6}$  [PRL 85, 2881 (2000)]

Exp. BaBar BF  $= [0.6 \pm 0.3 \pm 0.2 (< 1.1)] \times 10^{-6}$  ( $1.6\sigma$ ) [PRD 76, 071103 (2007)]

- Theoretical predictions

$\sim 0.5 \times 10^{-6}$  Flavour SU(3) +exp. [PRD 71, 051501 (2005); PRD 69, 034001 (2004)]

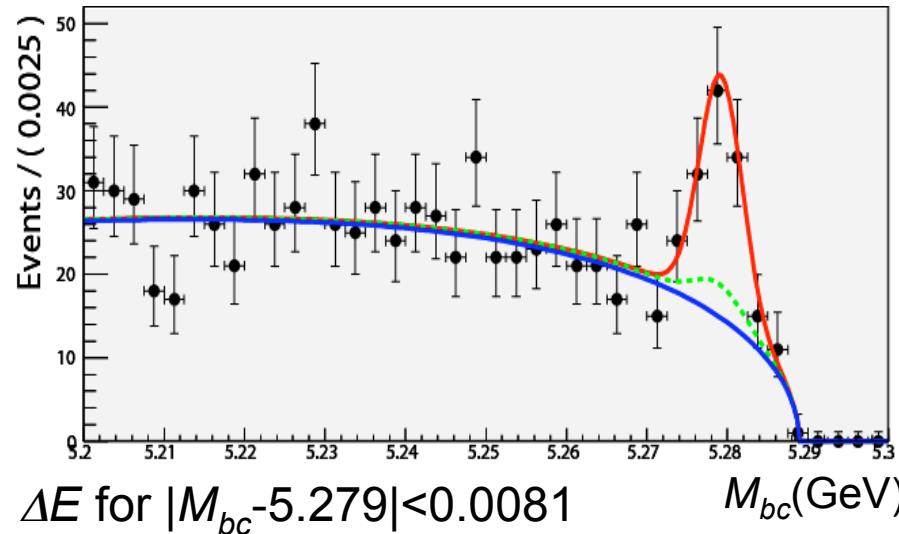

$\sim 0.3 \times 10^{-6}$  Perturbative QCD factorization [PRD 75, 014019 (2007)]

# Measurement of $B^- \rightarrow K^*(892)^0 K^-$ decay

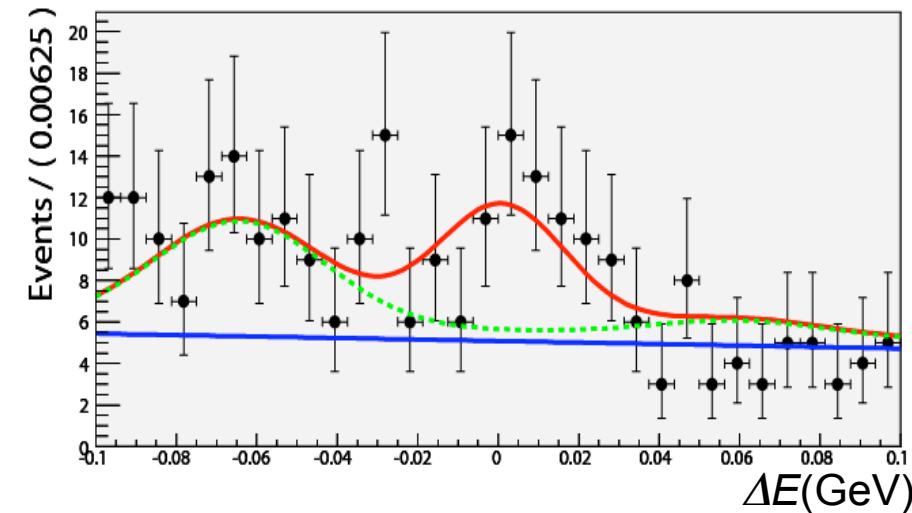

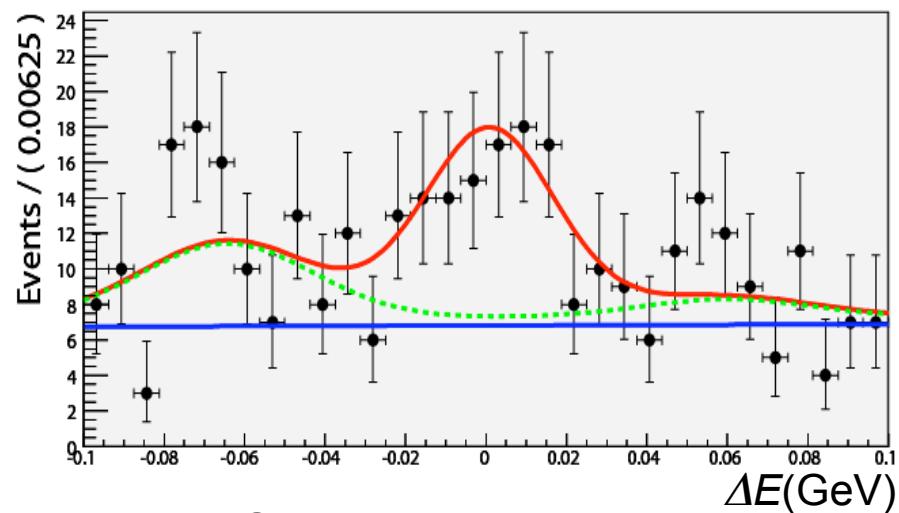

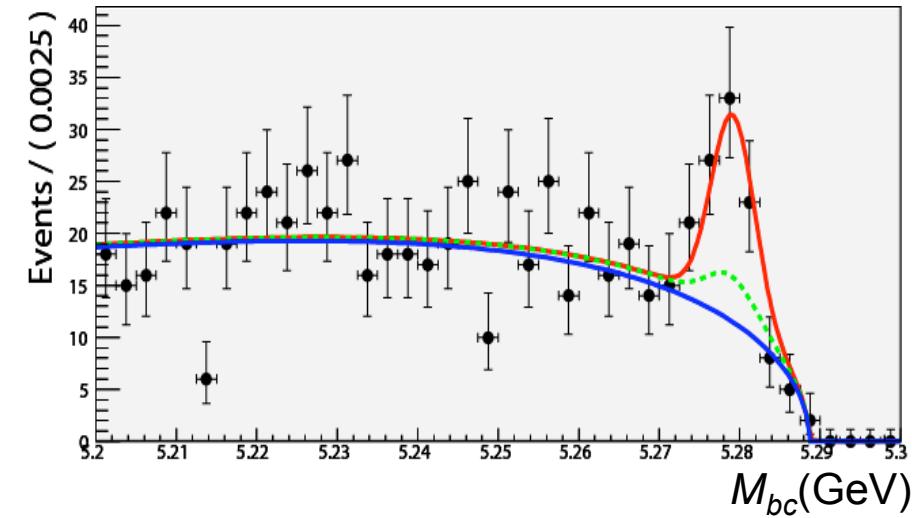

Belle 657M BB  
Preliminary

$M_{bc}$  for  $|\Delta E| < 0.043$

$B^- \rightarrow K^*(892)^0 K^-$

$B^- \rightarrow K^*(1430)^0 K^-$

— qq BG

(at this page the signal includes also  $B \rightarrow KK\pi$  component) 5

- - - rare-B BG

# Evidence of $B^- \rightarrow K^*(892)^0 K^-$

$B^- \rightarrow K^*(892)^0 K^-$

Yield :  $47.72 \pm 11.13$

BF :  $[0.68 \pm 0.16 \pm 0.10] \times 10^{-6}$  ( $4.4\sigma$ )

First evidence of  $B^- \rightarrow K^*(892)^0 K^-$

$B^- \rightarrow K_{1/2}^*(1430)^0 K^-$

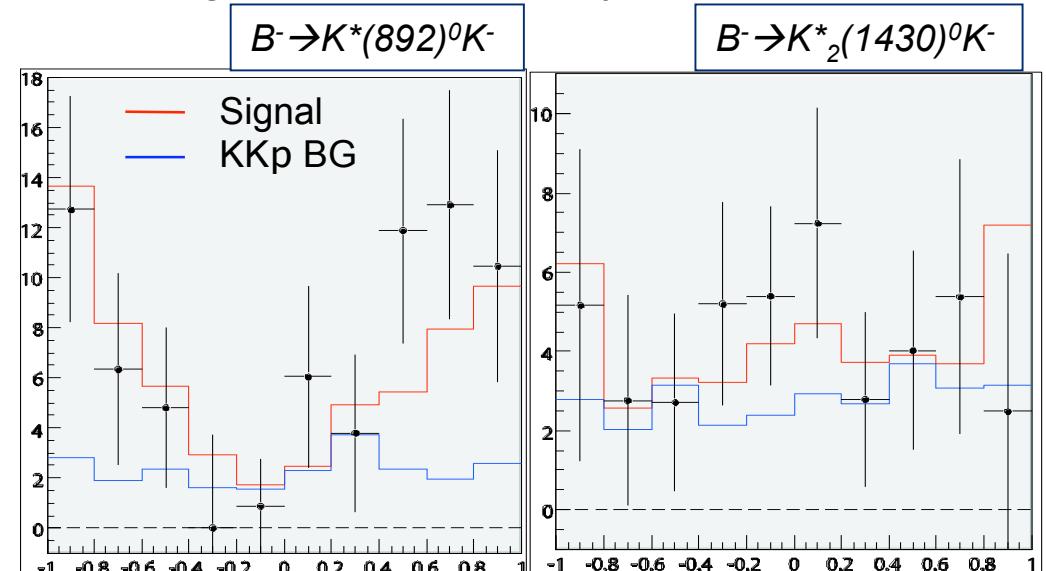

Yield :  $23.35 \pm 12.13$

BF :  $[0.63 \pm 0.33 \pm 0.12 (< 1.10)] \times 10^{-6}$  ( $1.5\sigma$ )

Belle 657M BB  
Preliminary

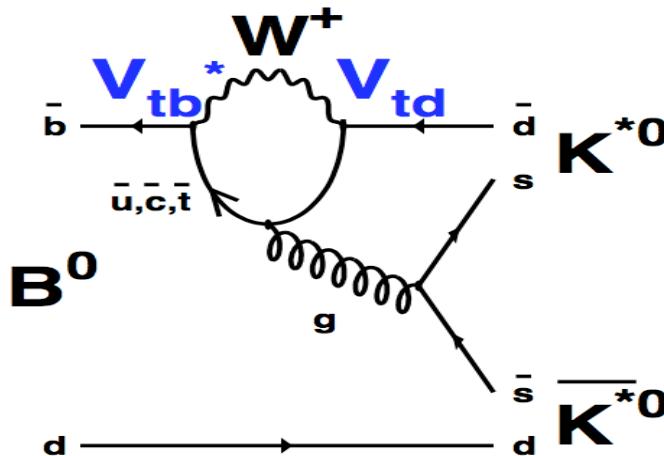

Yield of the  $K^*(892)^0 K^-$ ,  
 $K_{1/2}^*(1430)^0 K^-$ , and non-resonant  $KK\pi$  are determined by  $M(K\pi)$  fitting

Bkg subtracted helicity distributions

# $B^0 \rightarrow K^{*0} \bar{K}^{*0}$ Decay

- This is a  $B \rightarrow VV$  decay with  $b \rightarrow d$  process:

- The longitudinal polarization fraction  $f_L$  of  $K^{*0} \bar{K}^{*0}$  can verify a theoretical explanation for  $B^0 \rightarrow \phi K^{*0}$  puzzle ( $f_L \sim 0.5$ ). [Phys. Lett. B 622, 63 (2005)]
- A method for clean determination of the CKM phase angles  $\phi_2$  ( $\alpha$ ) and  $\phi_3$  ( $\gamma$ ) using only direct CP violation of decays  $B_{u,d,s} \rightarrow VV$ , such as  $B_{d,s} \rightarrow K^{*0} \bar{K}^{*0}$ . [PRD 65, 073018 (2002); PRD 76, 074005 (2007)]
- The current status:
  - BaBar:  $BF = (1.28^{+0.35}_{-0.30} \pm 0.11) \times 10^{-6}$  ( $6\sigma$ ),  $f_L = 0.80^{+0.10}_{-0.12} \pm 0.06$  [PRL 100, 081801 (2008)]
  - Theoretical predictions:  $BF = (0.17 \sim 0.92) \times 10^{-6}$ ,  $f_L = 0.04 \sim 1.0$  [PRD 72, 094026 (2005); Nucl. Phys. B774, 64 (2007); PRD 78, 094001 (2008)]

# $B^0 \rightarrow K^{*0} \bar{K}^{*0}$ Decay

Analysis method:

- Reconstruct  $B^0$  with four charged tracks (2 Kaons, 2 pions) :

$$B^0 \rightarrow K^{*0} \bar{K}^{*0} \rightarrow (K^+ \pi^-)(K^- \pi^+)$$

- Reconstructed variables :

- Beam-energy constrained mass:  $M_{bc} = \sqrt{E_{beam}^2 - P_B^2}$

- Energy difference :  $\Delta E = E_B - E_{beam}$

- Two  $K\pi$  invariant masses :  $M_{K\pi} = \sqrt{E_{K\pi}^2 - P_{K\pi}^2}$

$$B^0 \rightarrow K^{*0} \bar{K}^{*0} \rightarrow K^+ \pi^- K^- \pi^+$$

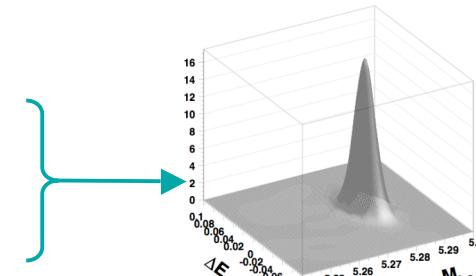

$$B^0 \rightarrow K^{*0} K^- \pi^+ \rightarrow K^+ \pi^- K^- \pi^+$$

$$B^0 \rightarrow K_0^*(1430) \bar{K}_0^*(1430) \rightarrow K^+ \pi^- K^- \pi^+$$

$$B^0 \rightarrow K_0^*(1430) \bar{K}^{*0} \rightarrow K^+ \pi^- K^- \pi^+$$

$$B^0 \rightarrow K_0^*(1430) K^- \pi^+ \rightarrow K^+ \pi^- K^- \pi^+$$

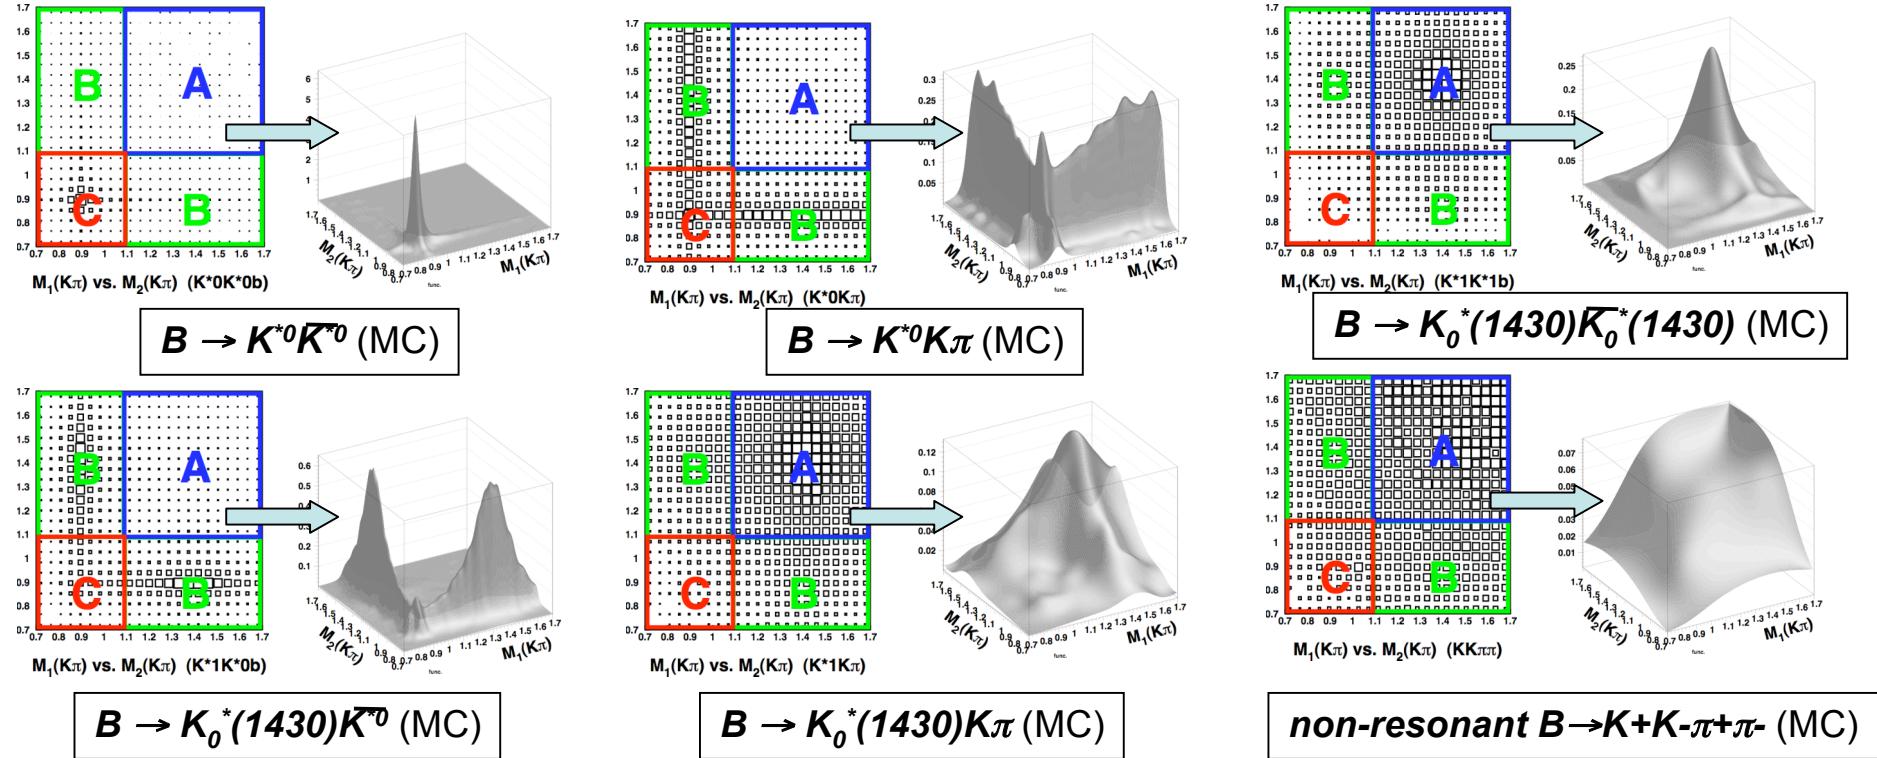

$$B^0 \rightarrow K^+ \pi^- K^- \pi^+$$

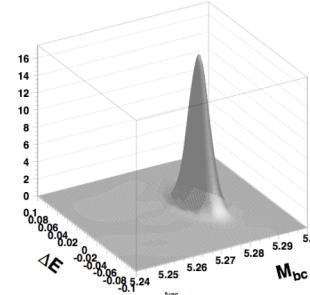

For  $B$  decays

We can distinguish and measure these decays from  $M_{K^+\pi^-}$  vs.  $M_{K^-\pi^+}$  distributions.

# $M_{1(K\pi)}$ vs. $M_{2(K\pi)}$ distributions for different $B$ decays

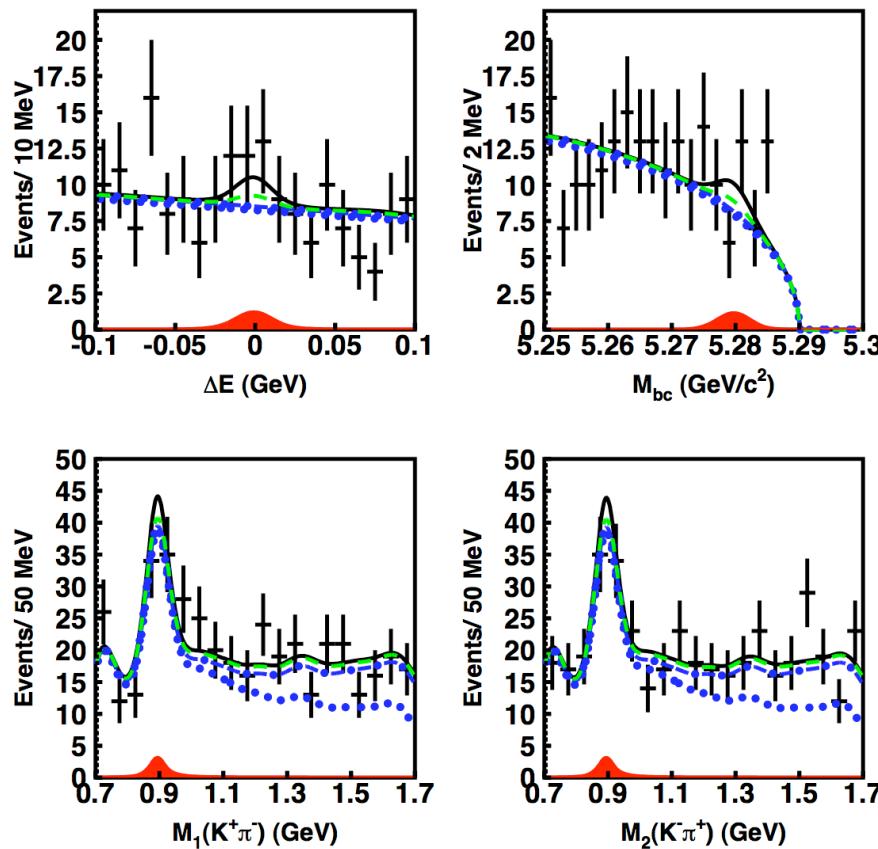

ps: Their ( $\Delta E$ ,  $M_{bc}$ ) distributions are the same:

# $B^0 \rightarrow K^{*0} \bar{K}^{*0}$ Decay

657M BB sample

Preliminary

- These plots are projected in  $K^{*0}\bar{K}^{*0}$  signal region:  
 $5.27 < M_{bc} < 5.29$  (GeV),  
 $|\Delta E| < 0.045$  (GeV) and  
 $0.826 < M_{1,2}(K\pi) < 0.966$  (GeV)

# $B^0 \rightarrow K^{*0}K^{*0}$ Decay

657M BB sample

Preliminary

- This mode has a different charge final state:  $(K^+\pi^-)(K^+\pi^-)$ .
- The standard model forbidden decay  $B^0 \rightarrow K^{*0}K^{*0}$  is not expected to be found unless there is a new process that we do not find yet.

# Summary

$B^- \rightarrow K^*(892)^0 K^-$  :

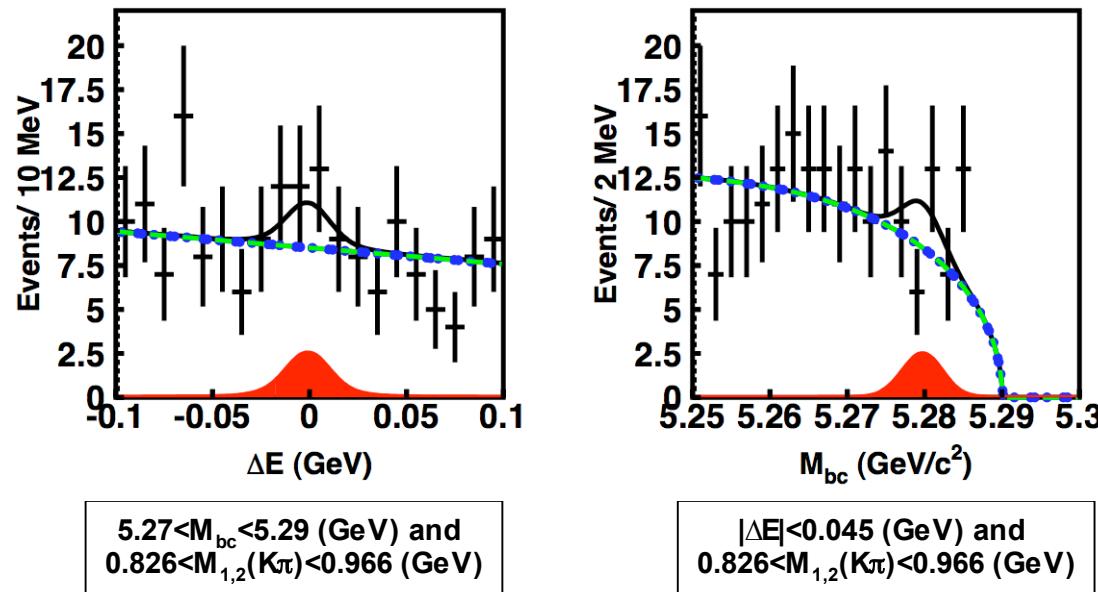

- We find evidence ( $4.4\sigma$ ) of this mode with the branching fraction ( $0.68 \pm 0.16 \pm 0.10$ )  $\times 10^{-6}$ .

$B^0 \rightarrow K^{*0} \bar{K}^{*0}$  :

- We measure the branching fraction of  $B^0 \rightarrow K^{*0} \bar{K}^{*0}$  to be ( $0.3 \pm 0.3 \pm 0.1$ )  $\times 10^{-6}$  with  $0.9\sigma$  significance, assuming  $f_L = 1$ , the 90% confidence level upper limit is  $< 0.8 \times 10^{-6}$ , which is within the theoretical prediction.
- The branching fraction from BaBar measurement is  $(1.28_{-0.30}^{+0.35} \pm 0.11) \times 10^{-6}$ , the difference of the mean branching fraction between BaBar and Belle is about  $1.4\sigma$ .
- For possible feeddown decays, such as non-resonant  $B^0 \rightarrow K K \pi \pi$  and  $B^0 \rightarrow K_0^*(1430) X$ , their yields from the simultaneous fit are not significant, so we set the corresponding upper limits.

# Backup

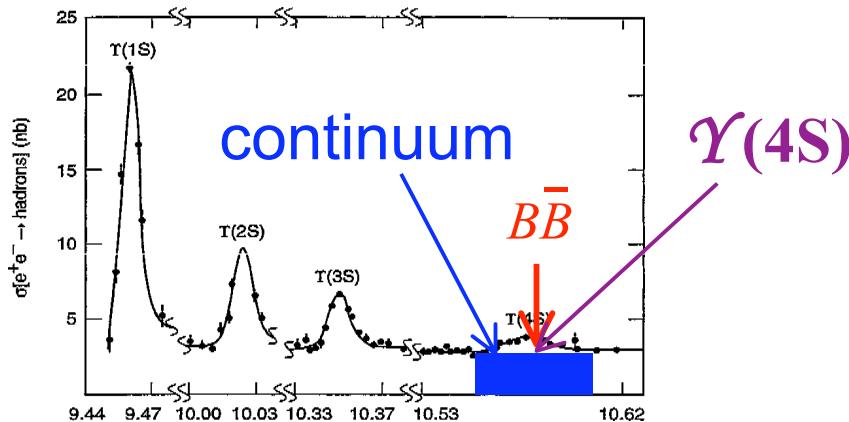

## 2-D ( $M_{bc}$ - $\Delta E$ ) fit in $B^0 \rightarrow K^{*0}\bar{K}^{*0}$ Signal Region

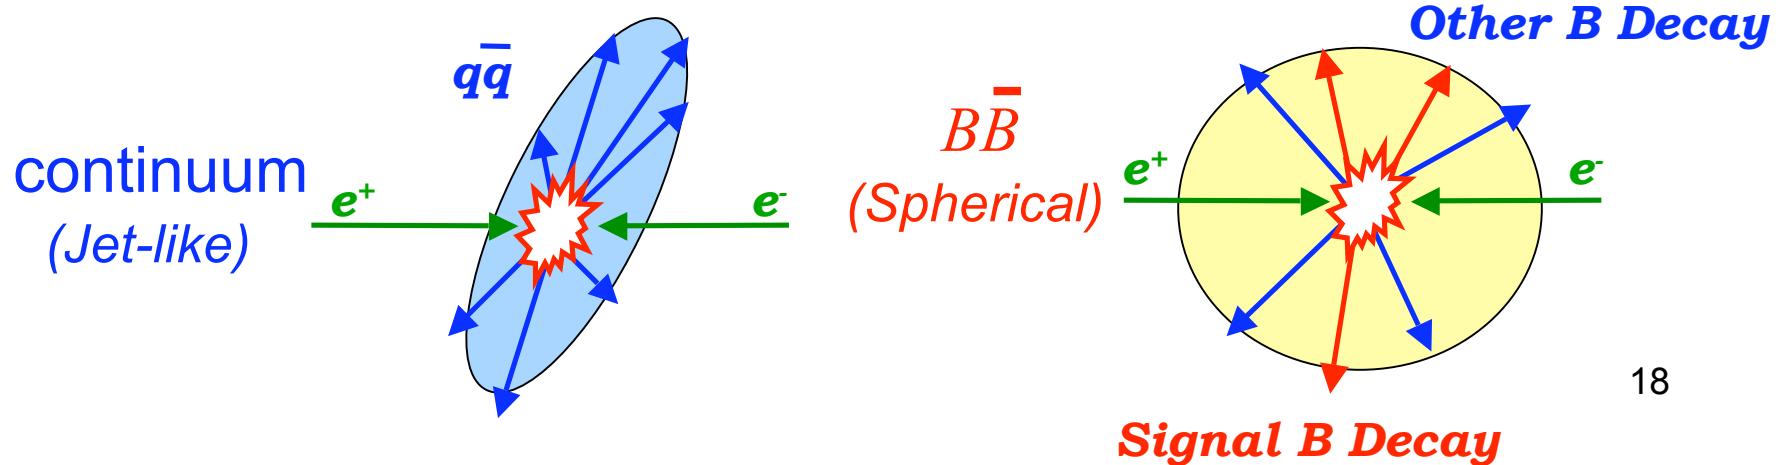

| Mode                 | Yield         | Eff. (%)             | BF ( $\times 10^{-6}$ ) |
|----------------------|---------------|----------------------|-------------------------|
| $K^{*0}\bar{K}^{*0}$ | $8.7 \pm 6.3$ | 2.78 ( $f_L = 1.0$ ) | $0.5 \pm 0.3$           |

# $e^+e^- \rightarrow q\bar{q}$ ( $q=u,d,s,c$ ) Background Suppression

- The dominant background in  $B$  analysis is  $e^+e^- \rightarrow q\bar{q}$  ( $q=u,d,s,c$ ), we called “continuum” ( $\sim 3x B\bar{B}$ ).

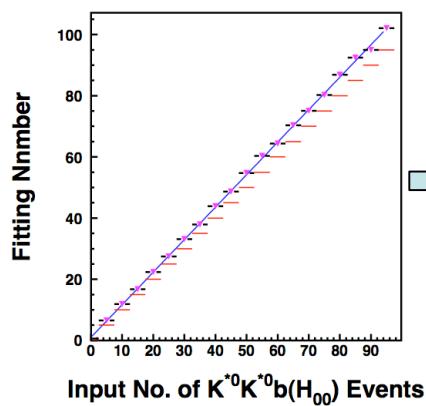

- To suppress continuum background, we use event shape variables and flavor tagging information.

# Fit Bias Study (for 4-D Fit)

- The correlations between ( $\Delta E$ ,  $M_{bc}$ ) and ( $M_1$ ,  $M_2$ ) would cause fit bias, we study this effect by MC with full detector simulation.
- We vary the input number of signal events in MC ensemble data, and then check the output number of signal events from 4-D fit (Fig. 1).
- To correct this fit bias we substitute the fit bias correction equations into 4-D fit likelihood function (Fig. 2).
- The **MC ensemble fit** can be also used to check the correctness of statistical error of the signal yields. We define **PULL = (fit no. - Input no. of MC) / (Stat. error from the fit)**, and check its distribution from MC ensemble fit (Fig. 3).

Before fit bias correction

After fit bias correction
