

Inclusive Photoproduction of ρ^0 , K^{*0} and ϕ Mesons at HERA

Friday, July 17, 2009 9:00 AM (20 minutes)

Inclusive non-diffractive photoproduction of $\rho(770)^0$, $K^{*}(892)^0$ and $\phi(1020)$ mesons is investigated with the H1 detector in ep collisions at HERA. The corresponding average γp centre-of-mass energy is 210 GeV. The mesons are measured in the transverse momentum range $0.5 < p_T < 7$ GeV and the rapidity range $|y_{\text{lab}}| < 1$. Differential cross sections are presented as a function of transverse momentum and rapidity, and are compared to the predictions of hadroproduction models.
