0-10% PbPb

0-10% PbPb

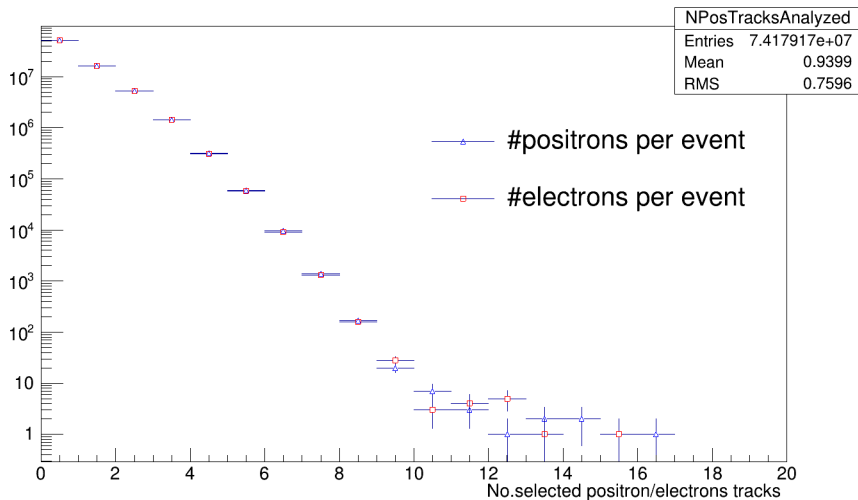

Done this week and continues: (Following the above plot)

- Monitoring observables run-wise \rightarrow the idea was to see the $\#$ of J/ψ -per run in 18q and 18r (code is ready).
 - 18r can be quantified run-wise.
 - 18q Histograms are missing the run information, because trees were merged before, So the analysis has to be re-run in parallel (currently copying them)
- For the Bullet-1, I compared *Same Event Like Sign* vs *Mixed Event Unlike sign* background rejection \rightarrow because we per run we have many times less statistics than period, so it is good to monitor which technique reduces the combinatorial background better.
- For 18r period, we can monitor the observables run-wise for e.g. DCAs, dEdx ... (NOW!)

$e^+ - e^-$ - Distributions

0-10% PbPb for LHC18r

→ Further, we a comparison of $\frac{\# \text{ of } pos}{\# \text{ of } neg}$ ratio for 18q, 18r and 18q+18r.

0-10% PbPb

→ Does it mean, In higher multiplicity events, more e^+e^- are mistagged??

0-10% PbPb

0-10% PbPb

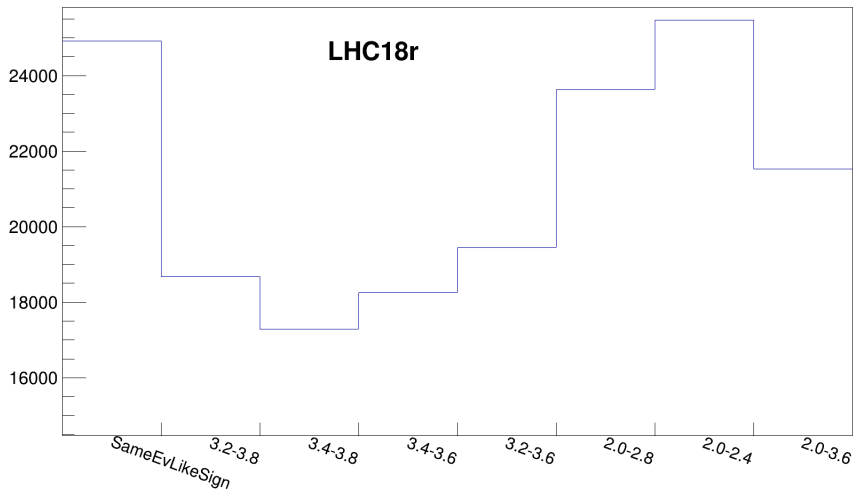

Same vs Mixed Bkg Rejection

0-10% PbPb

Comparison of Signal Yield in 0-15GeV / 0-10%

TPC N_e electron vs. run numbers, --s--

What's Next??

- J/ψ in MC (Meeting tomorrow at 10:00AM with Ionut)
- PsProper Length.
